Personal Narrative Proposal

My main story is how I came to discover my passion for wanting to study machine learning and data science. My family as a whole, my parents especially, are all very successful in the technology industry. For example, my mom is the CEO of a company that designs apps, advertisements, as well as runs analytics. My dad also is a free lance web and app designer who gets yearly government contracts and has been in the industry for over twenty years. I am a people pleaser, so ever since I was ten years old and learned what programming was, I wanted to follow in their footsteps and not look like a failure, especially that throughout the years they kept signing me up for programming classes. However, during these programming classes, especially my college courses, I developed a real passion for programming and finding things in data that most people cannot. My intended audience is future employers, I want them to grasp how great my passion for this industry is, where that passion comes from, and how this makes me who I am. My extended cover letter should show employers, hiring managers, and human resources leaders that in addition to looking qualified for the job, I am enthusiastic about working for this industry and making any contribution to making the world a better place.
